EXECUTIVE SUMMARY

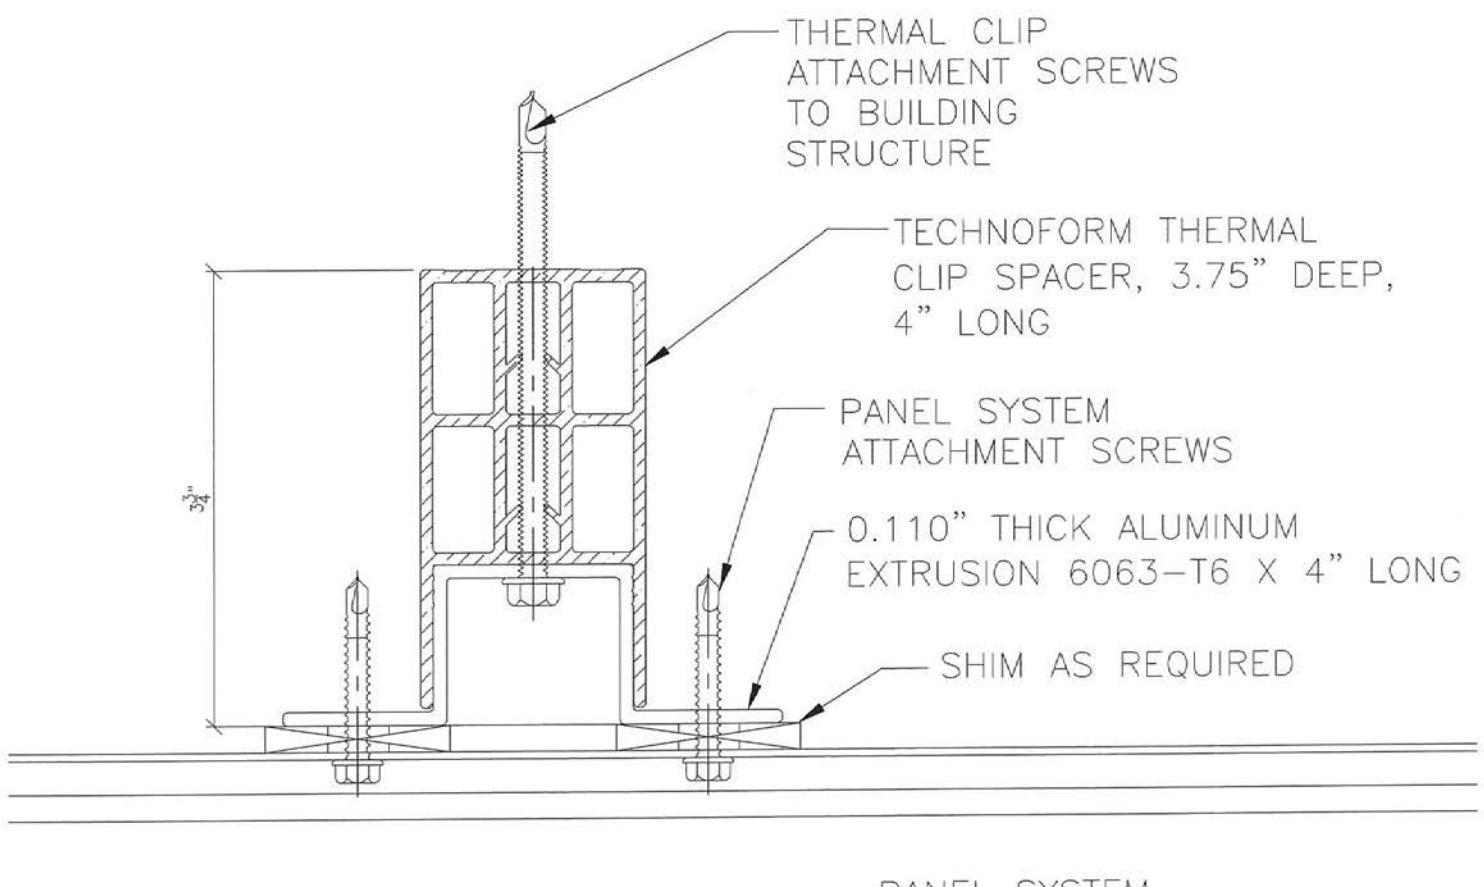

1. This calculation package represents the structural engineering review of the Technoform Thermal Clip spacer used for attachment of building cladding panel systems to the structural building substrate.
2. The Technoform Thermal Clip is manufactured from polyamide material with 40% glass fiber content and includes an aluminum extrusion component which provides the structural element for adequate fastening to the building structure and provides sufficient material for the panel system attachment screw thread engagement.
3. See "Thermal Clip Details" section of this package for an illustration of the Technoform Thermal Clip spacer.
4. This calculation package provides analysis for the basis of design of the thermal clip spacer when used with a common range of design wind pressures and panel system weights. See "Basis of Design" section of this package for specific design load ranges.
5. This calculation package includes evaluation of the thermal clip when attached to various building substrate conditions. The various building substrate conditions reviewed in this package include attachment to cold formed metal studs, wood studs, concrete and CMU. See "Basis of Design" section of this package for specific design considerations taken when attaching to each type of building substrate condition.
6. This package also includes structural tables which provide the user with an estimating tool for determining the quantity of thermal clips required for a particular project. The structural tables have been generated and are based on the engineering calculation methods enclosed in this package.

BASIS OF DESIGN

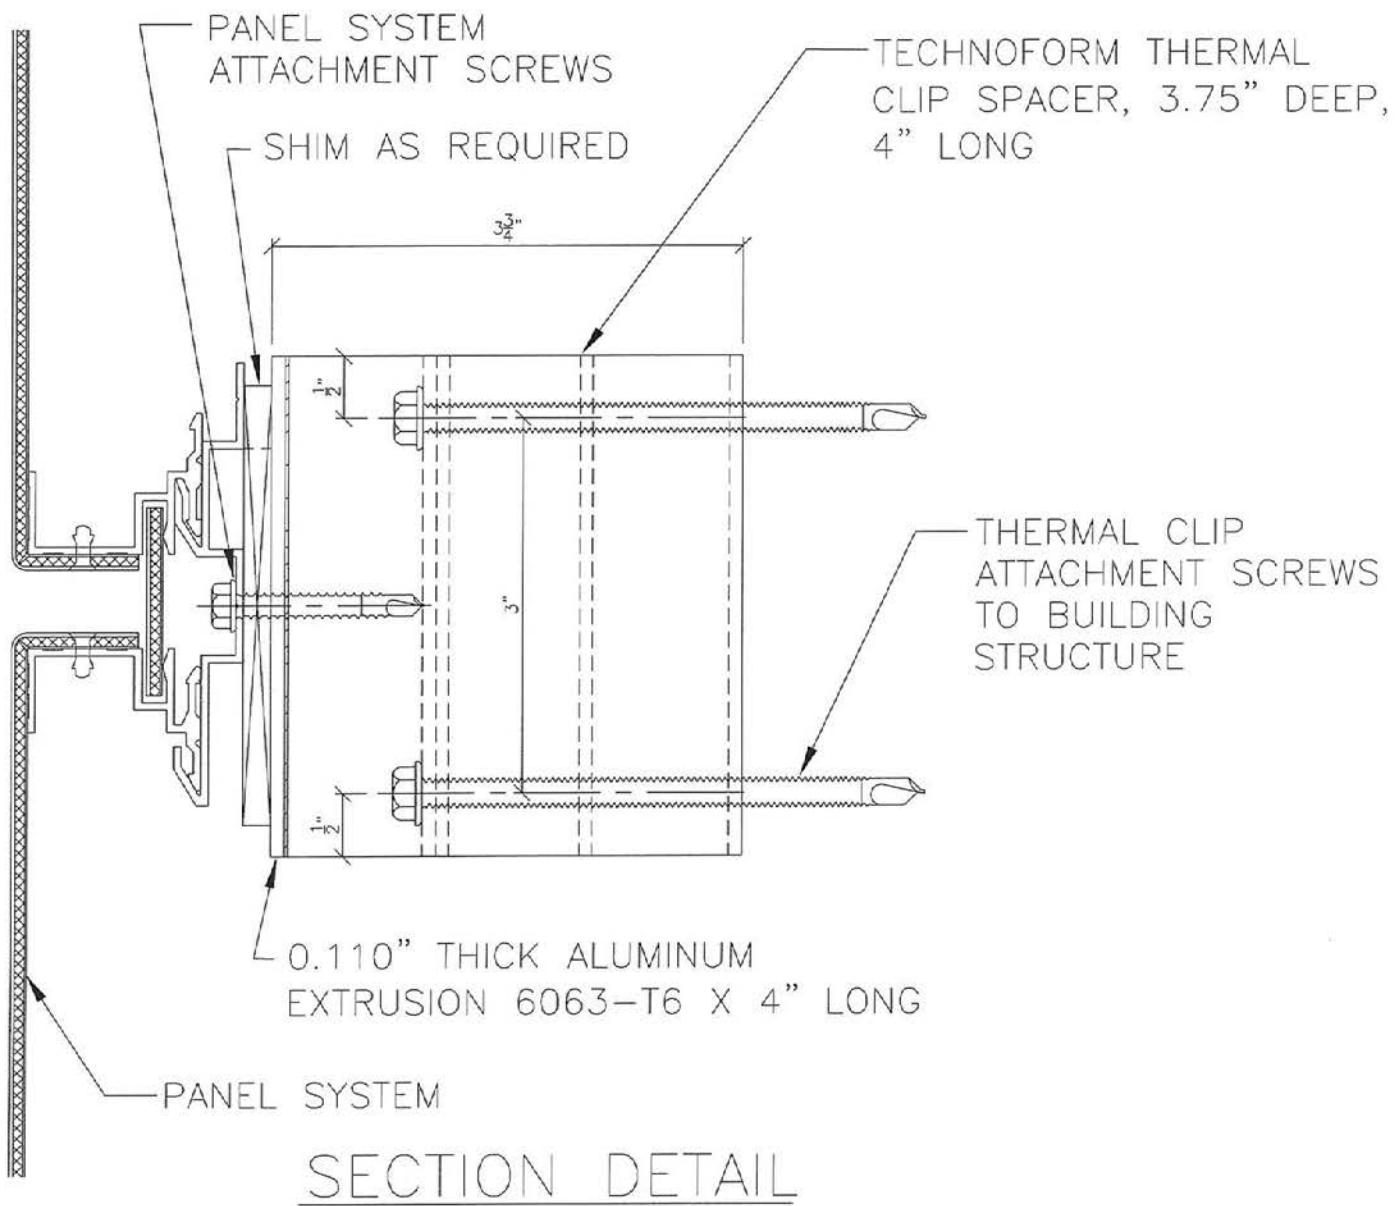

1. The square footage basis of design for this thermal clip product has been considered to be one clip per four square feet of panel cladding system.
2. The wind load pressures utilized for the basis of this thermal clip product have been considered in the range of 30 psf to 50 psf allowable wind pressures.
3. The panel cladding system weights utilized for the basis of this design have been considered in the range of 4.0 psf to 7.7 psf which includes, but is not limited to ACM panel systems, solid metal panel system & high performance concrete panel systems.
4. The screws attaching the panel system to the thermal block clip have been considered to be (2) $\frac{1}{4}$ -14 HWH Dril-Flex fasteners at each thermal clip.
5. The fasteners attaching the thermal clip to a building substrate consisting of 18 gauge cold formed metal studs have been considered to be (2) $\frac{1}{4}$ -14 HWH Dril-Flex fasteners at each thermal clip.
 - a. The cold formed metal studs considered in this attachment design are standard strength metals studs with yield strength $F_y=33$ ksi minimum & ultimate strength $F_u=45$ ksi minimum.
6. The fasteners attaching the thermal clip to a building substrate consisting of 16 gauge cold formed metal studs have been considered to be (2) $\frac{1}{4}$ -14 HWH Dril-Flex fasteners at each thermal clip.
 - a. The cold formed metal studs considered in this attachment design are standard strength metals studs with yield strength $F_y=33$ ksi minimum & ultimate strength $F_u=45$ ksi minimum.

7. The fasteners attaching the thermal clip to a building substrate consisting of structural wood studs have been considered to be (2) #14 wood screws with bending yield strength $F_y = 70$ ksi minimum with 1 ½" minimum penetration into the structural wood stud.
 - a. The structural wood studs considered in this attachment are Spruce-Pine-Fir with a specific gravity $G=0.42$ minimum.
8. The fasteners attaching the thermal clip to a building substrate consisting of solid concrete have been considered to be (2) ¼" Diameter Hilti Kwik-Con II+ Concrete and Masonry Screws with 1" nominal embedment into the structural concrete.
 - a. The concrete considered in this attachment design is 6" thick, NW concrete with minimum compressive strength $f'_c=3000$ psi.
9. The fasteners attaching the thermal clip to a building substrate consisting of hollow core concrete masonry units (CMU) have been considered to be (2) ¼" Diameter Hilti Kwik-Con II+ Concrete and Masonry Screws with 1" nominal embedment into the CMU.
 - a. The CMU considered in this attachment design is 6" thick, LW, MW or NW hollow core concrete masonry units with minimum compressive strength $f'_c=1500$ psi.

THERMAL CLIP DETAILS

PLAN DETAIL

THERMAL CLIP ANALYSIS

(ATTACHED TO 18 GAUGE COLD FORMED METAL STUDS)

Thermal Clip Analysis: Attached to 18 Gauge Cold Formed Metal Studs

Basis of Design Information

$S_{\text{stud}} := 16\text{in}$	(Typical Wall Construction - On Center Stud Spacing)
$S_{t_clip} := 36\text{in}$	(Thermal Clip Spacing Along Vertical Studs - Basis of Design Clip Spacing)
$A := S_{\text{stud}} \cdot S_{t_clip} = 4 \text{ ft}^2$	(Panel Area Per Thermal Clip - Basis of Design)
$WL_{tz} := 30 \cdot \text{psf}$	(Basis of Design Wind Pressure - Typical Wind Zone of Building)
$WL_{cz} := 50 \cdot \text{psf}$	(Basis of Design Wind Pressure - Corner Wind Zone of Building)
$DL_{\text{pnl_light}} := 2.0 \cdot \text{psf}$	(Basis of Design "Light" Panel Weight - 1/8" Solid Aluminum or 4mm ACM)
$DL_{\text{pnl_heavy}} := 5.7 \cdot \text{psf}$	(Basis of Design "Heavy" Panel Weight - 1/2" TATKL)
$DL_{\text{misc}} := 2.0 \cdot \text{psf}$	(Basis of Design Miscellaneous Materials - Extrusions / Z-Girts of Panel System)

Basis of Design Load Determination

Wind Load Reaction Per Thermal Clip

$$P_{\text{clip_WL_tz}} := A \cdot WL_{tz} = 120 \text{ lb} \quad (\text{Wind Load Reaction at Clips in Typical Zone Wind Region})$$

$$P_{\text{clip_WL_cz}} := A \cdot WL_{cz} = 200 \text{ lb} \quad (\text{Wind Load Reaction at Clips in Corner Zone Wind Region})$$

Dead Load Reaction Per Thermal Clip

$$P_{\text{clip_DL_light}} := A \cdot (DL_{\text{pnl_light}} + DL_{\text{misc}}) = 16 \text{ lb} \quad (\text{Dead Load Reaction - Light Panels})$$

$$P_{\text{clip_DL_heavy}} := A \cdot (DL_{\text{pnl_heavy}} + DL_{\text{misc}}) = 31 \text{ lb} \quad (\text{Dead Load Reaction - Heavy Panels})$$

Check 1/4-14 Drill-Flex into 0.100" 6063-T6 Aluminum Material (Fy=25 ksi min., Fu=30 ksi min.)

$d_1 := 0.25\text{in}$	(Screw Diameter)
$t_{\text{alum}} := 0.100\text{in}$	(Aluminum Thickness)
$F_y_{\text{alum}} := 25 \cdot \text{ksi}$	(Minimum Yield Strength of Aluminum)
$F_u_{\text{alum}} := 30 \cdot \text{ksi}$	(Minimum Ultimate Strength of Aluminum)

Allowable Shear / Bearing Capacity of Screws

$$V_{a_screw_AAMA} := 621 \cdot \text{lb}$$

(Screw Shear Strength Per AAMA TIR-A9-14)

$$V_{a_screw_ESR3332} := \frac{2692 \cdot \text{lb}}{3} = 897 \text{ lb}$$

(Screw Shear Strength Per ESR-3332)

$$V_{a_screw_ADM} := \frac{2d_1 \cdot t_{alum} \cdot F_{u_alum}}{3} = 500 \text{ lb}$$

(Screw Shear Bearing Strength Per Aluminum Design Manual 2010 Edition)

$$V_{a_screw} := \min(V_{a_screw_AAMA}, V_{a_screw_ESR3332}, V_{a_screw_ADM}) = 500 \text{ lb}$$

Allowable Tensile / Pull-Out Capacity of Screws

$$T_{a_screw_AAMA} := 1075 \cdot \text{lb}$$

(Screw Tensile Strength Per AAMA TIR-A9-14)

$$T_{a_screw_ESR3332} := \frac{4363 \cdot \text{lb}}{3} = 1454 \text{ lb}$$

(Screw Tensile Strength Per ESR-3332)

$$T_{a_screw_pullout_AAMA} := 236 \cdot \text{lb}$$

(Screw Pullout Strength Per AAMA TIR-A9-14)

$$T_{a_screw} := \min(T_{a_screw_AAMA}, T_{a_screw_ESR3332}, T_{a_screw_pullout_AAMA}) = 236 \text{ lb}$$

Check (2) Screws at Each Panel Connection to Thermal Clip

Shear in Screws at Light Panels

$$V_{max_light} := \frac{P_{clip_DL_light}}{2} = 8 \text{ lb} \quad < \quad V_{a_screw} = 500 \text{ lb}$$

if($V_{max_light} < V_{a_screw}$, "O.K.", "N.G.") = "O.K."

Shear in Screws at Heavy Panels

$$V_{max_heavy} := \frac{P_{clip_DL_heavy}}{2} = 15 \text{ lb} \quad < \quad V_{a_screw} = 500 \text{ lb}$$

if($V_{max_heavy} < V_{a_screw}$, "O.K.", "N.G.") = "O.K."

Tension in Screws at Panels in Typical Wind Zones

$$T_{max_tz} := \frac{P_{clip_WL_tz}}{2} = 60 \text{ lb} \quad < \quad T_{a_screw} = 236 \text{ lb}$$

if($T_{max_tz} < T_{a_screw}$, "O.K.", "N.G.") = "O.K."

Tension in Screws at Panels in Corner Wind Zones

$$T_{\max_cz} := \frac{P_{clip_WL_cz}}{2} = 100 \text{ lb} \quad < \quad T_{a_screw} = 236 \text{ lb}$$

if($T_{\max_cz} < T_{a_screw}$, "O.K.", "N.G.") = "O.K."

Check 1/4-14 Drill-Flex into 18 ga. Metal Stud Framing (Fy=33 ksi min., Fu=45 ksi min.)

$$\begin{aligned} d_2 &:= 0.25 \text{ in} && \text{(Screw Diameter)} \\ t_{stud} &:= 0.048 \text{ in} && \text{(Metal Stud Thickness)} \\ t_{stud_SSMA} &:= 0.0451 \text{ in} && \text{(SSMA Metal Stud Thickness)} \\ F_{y_stud} &:= 33 \cdot \text{ksi} && \text{(Minimum Yield Strength of Metal Studs)} \\ F_{u_stud} &:= 45 \cdot \text{ksi} && \text{(Minimum Ultimate Strength of Metal Studs)} \end{aligned}$$

Allowable Shear / Bearing Capacity of Screws

$$\begin{aligned} V_{a_screw2_AAMA} &:= 621 \cdot \text{lb} && \text{(Screw Shear Strength Per AAMA TIR-A9-14)} \\ V_{a_screw2_ESR3332} &:= \frac{2692 \cdot \text{lb}}{3} = 897 \text{ lb} && \text{(Screw Shear Strength Per ESR-3332)} \\ V_{a_screw2_ESR3332_brg} &:= 377 \cdot \text{lb} && \text{(Screw Shear Bearing Strength Per ESR-3332)} \\ V_{a_screw2_DF} &:= \frac{1395 \cdot \text{lb}}{3} = 465 \text{ lb} && \text{(Screw Shear Bearing Strength Per Drill-Flex)} \\ V_{a_screw2_AISI} &:= \frac{4.2 \sqrt{t_{stud}^3 \cdot d_2 \cdot F_{u_stud}}}{3} = 331 \text{ lb} && \text{(Screw Shear Bearing Strength Per AISI Cold Formed Steel Design 2008 Edition)} \\ V_{a_screw2_SSMA} &:= \frac{4.2 \sqrt{t_{stud_SSMA}^3 \cdot d_2 \cdot F_{u_stud}}}{3} = 302 \text{ lb} && \text{(Screw Shear Bearing Strength Per AISI Cold Formed Steel Design 2008 Edition-SSMA)} \\ V_{a_screw2_shear} &:= \min(V_{a_screw2_AAMA}, V_{a_screw2_ESR3332}) = 621 \text{ lb} \\ V_{a_screw2_bearing} &:= \min(V_{a_screw2_ESR3332_brg}, V_{a_screw2_DF}, V_{a_screw2_AISI}, V_{a_screw2_SSMA}) = 302 \text{ lb} \\ V_{a_screw2} &:= \min(V_{a_screw2_shear}, V_{a_screw2_bearing}) = 302 \text{ lb} \end{aligned}$$

Allowable Tensile / Pull-Out Capacity of Screws

$$T_{a_screw2_AAMA} := 1075 \text{ lb} \quad (\text{Screw Tensile Strength Per AAMA TIR-A9-14})$$

$$T_{a_screw2_ESR3332} := \frac{4363 \cdot \text{lb}}{3} = 1454 \text{ lb} \quad (\text{Screw Tensile Strength Per ESR-3332})$$

$$T_{a_screw2_ESR3332_po} := 131 \text{ lb} = 131 \text{ lb} \quad (\text{Screw Tensile Pull-Out Strength Per ESR-3332})$$

$$T_{a_screw2_DF} := \frac{398 \cdot \text{lb}}{3} = 133 \text{ lb} \quad (\text{Screw Tensile Pull-Out Strength Per Dril-Flex})$$

$$T_{a_screw2_AISI} := \frac{0.85 t_{\text{stud}} \cdot d_2 \cdot F_{u_stud}}{3} = 153 \text{ lb} \quad (\text{Screw Tensile Pull-Out Strength Per AISI Cold Formed Steel Design 2008 Edition})$$

$$T_{a_screw2_SSMA} := \frac{0.85 t_{\text{stud_SSMA}} \cdot d_2 \cdot F_{u_stud}}{3} = 144 \text{ lb} \quad (\text{Screw Tensile Pull-Out Strength Per AISI Cold Formed Steel Design 2008 Edition-SSMA})$$

$$T_{a_screw2_tension} := \min(T_{a_screw2_AAMA}, T_{a_screw2_ESR3332}) = 1075 \text{ lb}$$

$$T_{a_screw2_pullout} := \min(T_{a_screw2_ESR3332_po}, T_{a_screw2_DF}, T_{a_screw2_AISI}, T_{a_screw2_SSMA}) = 131 \text{ lb}$$

$$T_{a_screw2} := \min(T_{a_screw2_tension}, T_{a_screw2_pullout}) = 131 \text{ lb}$$

Check (2) Screws at Each Thermal Clip Connection to Metal Stud Wall

Shear in Screws at Light Panels

$$V_{\max_light2} := \frac{P_{\text{clip_DL_light}}}{2} = 8 \text{ lb} \quad < \quad V_{a_screw2} = 302 \text{ lb}$$

if($V_{\max_light2} < V_{a_screw2}$, "O.K.", "N.G.") = "O.K."

Shear in Screws at Heavy Panels

$$V_{\max_heavy2} := \frac{P_{\text{clip_DL_heavy}}}{2} = 15 \text{ lb} \quad < \quad V_{a_screw2} = 302 \text{ lb}$$

if($V_{\max_heavy2} < V_{a_screw2}$, "O.K.", "N.G.") = "O.K."

Tension in Screws at Light Panels in Typical Wind Zones

$$T_{\max_tz_light} := \frac{P_{clip_WL_tz}}{2} + \frac{P_{clip_DL_light} \cdot 3.75in}{3in} = 80 \text{ lb} < T_{a_screw2} = 131 \text{ lb}$$

if($T_{\max_tz_light} < T_{a_screw2}$, "O.K.", "N.G.") = "O.K."

Tension in Screws at Light Panels in Corner Wind Zones

$$T_{\max_cz_light} := \frac{P_{clip_WL_cz}}{2} + \frac{P_{clip_DL_light} \cdot 3.75in}{3in} = 120 \text{ lb} < T_{a_screw2} = 131 \text{ lb}$$

if($T_{\max_cz_light} < T_{a_screw2}$, "O.K.", "N.G.") = "O.K."

Tension in Screws at Heavy Panels in Typical Wind Zones

$$T_{\max_tz_heavy} := \frac{P_{clip_WL_tz}}{2} + \frac{P_{clip_DL_heavy} \cdot 3.75in}{3in} = 98 \text{ lb} < T_{a_screw2} = 131 \text{ lb}$$

if($T_{\max_tz_heavy} < T_{a_screw2}$, "O.K.", "N.G.") = "O.K."

Tension in Screws at Heavy Panels in Corner Wind Zones

$$T_{\max_cz_heavy} := \frac{P_{clip_WL_cz}}{2} + \frac{P_{clip_DL_heavy} \cdot 3.75in}{3in} = 138 \text{ lb} > T_{a_screw2} = 131 \text{ lb}$$

if($T_{\max_cz_heavy} < T_{a_screw2}$, "O.K.", "N.G.") = "N.G."

only 5.3% over, say "O.K."

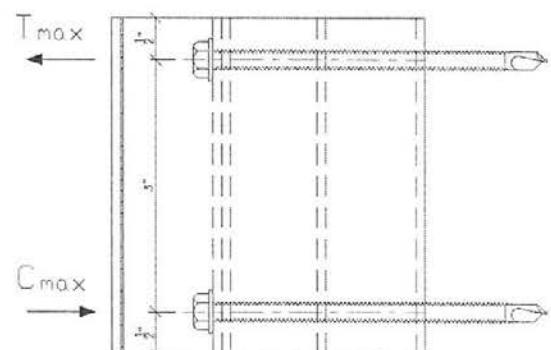

Check Compression Stress in Thermal Block Material

$$T_{\max} := \max(T_{\max_tz_light}, T_{\max_cz_light}, T_{\max_tz_heavy}, T_{\max_cz_heavy}) = 138 \text{ lb}$$

$$C_{\max} := T_{\max} = 138 \text{ lb}$$

$$F_{c_25} := 9840 \text{ psi} \quad \text{Compressive strength of block material (25% Glass Fill)}$$

$$F_{c_40} := 13600 \text{ psi} \quad \text{Compressive strength of block material (40% Glass Fill)}$$

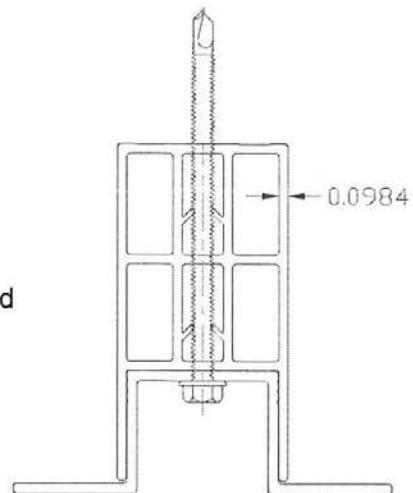

Consider all compressive to act at bottom 1" of block.

$$t_{block_wall} := 0.0984\text{in}$$

$$f_c := \frac{C_{max}}{4 \cdot 1\text{in} \cdot 0.0984\text{in}} = 352\text{-psi} \quad <<< \quad F_{c_25} = 9840\text{-psi}$$

Compression stress in block material is much less than the material compressive strength. Block material is adequate for imposed compressive force.

Check 0.100" 6063-T6 Aluminum Clip (Fy=25 ksi min., Fu=30 ksi min.)

$$t_{alum} = 0.1000\text{-in} \quad (\text{Aluminum Thickness})$$

$$L_{alum} := 4\text{in} \quad (\text{Aluminum Length})$$

$$F_{y_alum} = 25\text{-ksi} \quad (\text{Minimum Yield Strength of Aluminum})$$

$$F_{u_alum} = 30\text{-ksi} \quad (\text{Minimum Ultimate Strength of Aluminum})$$

$$F_{su_alum} := 19\text{ksi} \quad (\text{Minimum Ultimate Shear Strength of Aluminum})$$

Wind Load at Screw Locations

$$P_{WL} := \max\left(\frac{P_{clip_WL_tz}}{2}, \frac{P_{clip_WL_cz}}{2}\right) = 100\text{ lb}$$

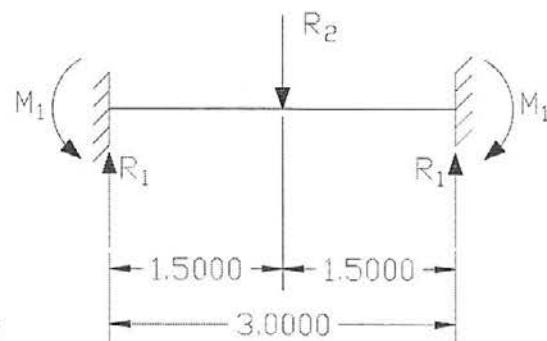

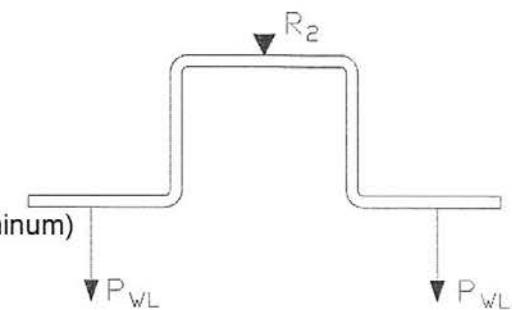

Wind Load Reaction at R₂ Location

$$R_{2_WL} := 2 \cdot P_{WL} = 200\text{ lb}$$

Weak Axis Moment / Stress at R₂ Location From Wind Load

$$M_{max_wa_R2} := \frac{R_{2_WL} \cdot 3\text{in}}{8} = 75\text{-in-lb}$$

WIND LOAD DIAGRAM

$$f_{b_wa_R2} := \frac{M_{max_wa_R2}}{\frac{1}{6} \cdot L_{alum} \cdot t_{alum}}^2 = 11250 \cdot \text{psi}$$

$$F_{b_wa_alum} := 19700 \cdot \text{psi}$$

$$f_{b_wa_R2} = 11250 \cdot \text{psi} < F_{b_wa_alum} = 19700 \cdot \text{psi}$$

$\text{if}(f_{b_wa_R2} < F_{b_wa_alum}, \text{"O.K."}, \text{"N.G."}) = \text{"O.K."}$

Dead Load at Screw Locations

$$P_{DL} := \max\left(\frac{P_{clip_DL_light}}{2}, \frac{P_{clip_DL_heavy}}{2}\right) = 15 \text{ lb}$$

Dead Load Reaction at R₂ Location

$$R_{2_DL} := 2 \cdot P_{DL} = 31 \text{ lb}$$

Strong Axis Moment / Stress at R₂ Location

$$M_{max_sa_DL} := \frac{R_{2_DL} \cdot 3\text{in}}{4} = 23 \cdot \text{in} \cdot \text{lb}$$

$$f_{b_sa_DL} := \frac{M_{max_sa_DL}}{\frac{1}{6} \cdot t_{alum} \cdot L_{alum}}^2 = 87 \cdot \text{psi}$$

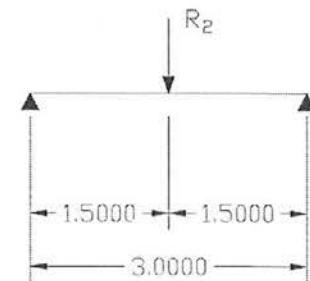

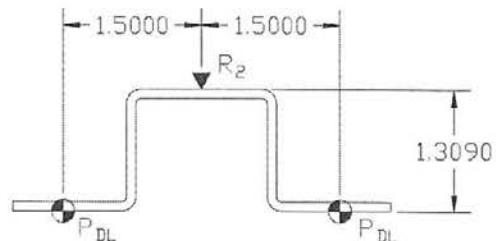

$$S_{b_limit} := \frac{L_{alum}}{t_{alum}} \cdot \sqrt{\left(\frac{1.5\text{in}}{1.0 \cdot L_{alum}}\right)} = 24$$

$$F_{b_sa_alum} := 27.9 \text{ksi} - 0.532 \text{ksi} \cdot (S_{b_limit}) = 14869 \cdot \text{psi}$$

$$f_{b_sa_DL} = 87 \cdot \text{psi} < F_{b_sa_alum} = 14869 \cdot \text{psi}$$

$\text{if}(f_{b_sa_DL} < F_{b_sa_alum}, \text{"O.K."}, \text{"N.G."}) = \text{"O.K."}$

DEAD LOAD DIAGRAM

Torsional Moment / Stress at R₂ Location

$$M_{max_v\tau_R2} := P_{DL} \cdot 1.3090in = 20 \cdot in \cdot lb$$

$$f_{v\tau_R2} := \frac{M_{max_v\tau_R2} \cdot t_{alum}}{\frac{1}{3} \cdot L_{alum} \cdot t_{alum}^3} = 1512 \cdot psi$$

$$S_{v\tau_limit} := \frac{L_{alum}}{t_{alum}} = 40$$

$$F_{v\tau_alum} := 11.5ksi - 0.062ksi \cdot (S_{v\tau_limit}) = 9020 \cdot psi$$

$$f_{v\tau_R2} = 1512 \cdot psi < F_{v\tau_alum} = 9020 \cdot psi$$

if($f_{v\tau_R2} < F_{v\tau_alum}$, "O.K.", "N.G.") = "O.K."

Combined Stress Ratio

$$CSR_{alum} := \left(\frac{f_{b_wa_R2}}{F_{b_wa_alum}} + \frac{f_{b_sa_DL}}{F_{b_sa_alum}} \right)^2 + \left(\frac{f_{v\tau_R2}}{F_{v\tau_alum}} \right)^2 = 0.361 < 1.000$$

$$\text{if}(CSR_{alum} < 1.000, "O.K.", "N.G.") = "O.K."$$

THERMAL CLIP ANALYSIS

(ATTACHED TO 16 GAUGE COLD FORMED METAL STUDS)

Thermal Clip Analysis: Attached to 16 Gauge Cold Formed Metal Studs

Basis of Design Information

$S_{\text{stud}} := 16\text{in}$	(Typical Wall Construction - On Center Stud Spacing)

DEAD LOAD (PSF)

How to use Estimating Table:

- Determine project specific cladding design wind pressure (psf) and cladding system dead load (psf)
- Find the corresponding design wind load in the left most column (round up to the nearest increment)
- Find the corresponding design dead load in the bottom row (round up to the nearest increment)
- Find the intersecting point on the table to determine the number of square footage each thermal clip can support.
- Divide the project cladding square footage by the number pulled from the table to determine the approximate number of clips required for the project.

Notes:

- This table is based on the thermal clips being attached to 18 gauge standard strength metal studs ($F_y=33\text{ksi min.}$, $F_u=45\text{ksi min.}$)
- This table is based on the thermal clips being attached to the metal stud wall with (2) 1/4"-14 x 4" HWH ELCO Dril-Flex Screws with #2 Point at 3" O.C. vertical spacing.
- This table is based on the use of 3 3/4" deep x 4" long thermal clips
- This table is based on the thermal clips being oriented with the length of clips running vertically.
- This table is based on thermal clip capacity and does not account for specific support requirements of various cladding systems & joineries that may have an impact on the required clip quantity for the project.
- Although combinations of the lower pressures indicate a relatively high square footage per clip, most cladding systems will require more clips than indicated for adequate support.
- Load combinations resulting in tabulated values of (1) square foot per clip may require a closer stud spacing than the traditional 16" o.c. wall construction.

DEAD LOAD (PSF)

How to use Estimating Table:

- Determine project specific cladding design wind pressure (psf) and cladding system dead load (psf)
- Find the corresponding design wind load in the left most column (round up to the nearest increment)
- Find the corresponding design dead load in the bottom row (round up to the nearest increment)
- Find the intersecting point on the table to determine the number of square footage each thermal clip can support.
- Divide the project cladding square footage by the number pulled from the table to determine the approximate number of clips required for the project.

Notes:

- This table is based on the thermal clips being attached to 1500 psi min prism strength LV, MW, or NW hollow concrete masonry
- This table is based on the thermal clips being attached to the hollow core concrete masonry units wall with (2) 1/4" Hilti KWIK-CON II+ Concrete screw at 3" O.C. vertical spacing with a 1" nominal embedment depth.
- This table is based on the use of 3 3/4" deep x 4" long thermal clips.
- This table is based on the thermal clips being oriented with the length of clips running vertically.
- This table is based on thermal clip capacity and does not account for specific support requirements of various cladding systems & joineries that may have an impact on the required clip quantity for the project.
- Although combinations of the lower pressures indicate a relatively high square footage per clip, most cladding systems will require more clips than indicated for adequate support.
